Questions from Lab

- How did you find the bugs that you found?

Enter Wanted Website

We attempted to enter information into the input strings as defined by the

Parameters. The input strings did not match the parameters. There were also several misspellings and data classes that did not match.

Yoodlize website

We found bugs that were more related to user feedback. Review stars did not link to a list of reviews for the product.

- **Compare your tests to your classmates**
 - Are your tests more broad or specific?
 - What are the pros and cons of specific test steps?

Pros:

- You can test every element of a website.
- You can verify that the website is working as intended.
- Testing specific items makes for a more refined and polished user experience. With no small bugs that might turn a user off.

Cons:

- More difficult to reproduce specific bugs
- Fixing bugs might create more errors/bugs
- More difficult to find and see bugs when you don't know what the function should be.

- What are the pros and cons of broad test steps?

Pros:

- Simple, Maintainable, Usable
- More open ended allows you to find more bugs or errors
- Allows for non-tech users to explore and find bugs you may not see or wouldn't realize.

Cons:

- Without specific user testing there may be elements that do not work together that we don't see.
- Non-specific testing may leave a website appearing less refined or polished.
